Archivage et Compression

Archivage

Afin de poursuivre, il convient de créer une arborescence à sauvegarder :

```
opensuse:~ # mkdir -p /test/repY; mkdir /test/repZ
opensuse:~ # cd /test/repY; touch Y1 Y2 Y3
opensuse:/test/repY # cd /test/repZ; touch Z1 Z2
opensuse:/test/repZ # ls -lR /test
/test:
total 8
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repY
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repZ

/test/repY:
total 0
-rw-r--r-- 1 root root 0 Feb  1 12:08 Y1
-rw-r--r-- 1 root root 0 Feb  1 12:08 Y2
-rw-r--r-- 1 root root 0 Feb  1 12:08 Y3

/test/repZ:
total 0
-rw-r--r-- 1 root root 0 Feb  1 12:08 Z1
-rw-r--r-- 1 root root 0 Feb  1 12:08 Z2
```

tar

Présentation

Le programme **tar** a été originellement prévu pour sauvegarder sur des bandes magnétiques, d'où son nom issu de **tape archiver**.

La commande **tar** peut sauvegarder vers :

- un fichier spécial, par exemple le nom d'un lecteur de bande,
- un fichier ordinaire sur disque,
- la sortie standard pour être utilisé dans un pipe.

Options de la Commande

Les options de la commande tar sont :

```
opensuse:/test/repZ # tar --help
Usage: tar [OPTION...] [FILE]...
GNU `tar' saves many files together into a single tape or disk archive, and can
restore individual files from the archive.
```

Examples:

```
tar -cf archive.tar foo bar # Create archive.tar from files foo and bar.
tar -tvf archive.tar       # List all files in archive.tar verbosely.
tar -xf archive.tar        # Extract all files from archive.tar.
```

Main operation mode:

```
-A, --catenate, --concatenate  append tar files to an archive
-c, --create                   create a new archive
-d, --diff, --compare         find differences between archive and file system
--delete                       delete from the archive (not on mag tapes!)
```

```
-r, --append      append files to the end of an archive
-t, --list        list the contents of an archive
  --test-label    test the archive volume label and exit
-u, --update      only append files newer than copy in archive
-x, --extract, --get  extract files from an archive
```

Operation modifiers:

```
--check-device    check device numbers when creating incremental
                  archives (default)
-g, --listed-incremental=FILE  handle new GNU-format incremental backup
-G, --incremental  handle old GNU-format incremental backup
  --ignore-failed-read  do not exit with nonzero on unreadable files
  --level=NUMBER    dump level for created listed-incremental archive
-n, --seek         archive is seekable
  --no-check-device  do not check device numbers when creating
                  incremental archives
  --no-seek         archive is not seekable
  --occurrence[=NUMBER]  process only the NUMBERth occurrence of each file
                  in the archive; this option is valid only in
                  conjunction with one of the subcommands --delete,
                  --diff, --extract or --list and when a list of
                  files is given either on the command line or via
                  the -T option; NUMBER defaults to 1
  --sparse-version=MAJOR[.MINOR]
                  set version of the sparse format to use (implies
                  --sparse)
-S, --sparse       handle sparse files efficiently
```

Overwrite control:

```
-k, --keep-old-files  don't replace existing files when extracting
  --keep-newer-files  don't replace existing files that are newer than
                  their archive copies
```

```
--no-overwrite-dir  preserve metadata of existing directories
--overwrite         overwrite existing files when extracting
--overwrite-dir     overwrite metadata of existing directories when
                    extracting (default)
--recursive-unlink  empty hierarchies prior to extracting directory
--remove-files      remove files after adding them to the archive
-U, --unlink-first  remove each file prior to extracting over it
-W, --verify        attempt to verify the archive after writing it
```

Select output stream:

```
--ignore-command-error ignore exit codes of children
--no-ignore-command-error  treat non-zero exit codes of children as
                           error
-0, --to-stdout           extract files to standard output
--to-command=COMMAND      pipe extracted files to another program
```

Handling of file attributes:

```
--atime-preserve[=METHOD]  preserve access times on dumped files, either
                           by restoring the times after reading
                           (METHOD='replace'; default) or by not setting the
                           times in the first place (METHOD='system')
--delay-directory-restore  delay setting modification times and
                           permissions of extracted directories until the end
                           of extraction
--group=NAME               force NAME as group for added files
--mode=CHANGES             force (symbolic) mode CHANGES for added files
--mtime=DATE-OR-FILE       set mtime for added files from DATE-OR-FILE
-m, --touch                don't extract file modified time
--no-delay-directory-restore
                           cancel the effect of --delay-directory-restore
                           option
--no-same-owner             extract files as yourself (default for ordinary
```

```
users)
--no-same-permissions  apply the user's umask when extracting permissions
                       from the archive (default for ordinary users)
--numeric-owner       always use numbers for user/group names
--owner=NAME          force NAME as owner for added files
-p, --preserve-permissions, --same-permissions
                       extract information about file permissions
                       (default for superuser)
--preserve            same as both -p and -s
--same-owner          try extracting files with the same ownership as
                       exists in the archive (default for superuser)
-s, --preserve-order, --same-order
                       sort names to extract to match archive
```

Device selection and switching:

```
-f, --file=ARCHIVE    use archive file or device ARCHIVE
--force-local         archive file is local even if it has a colon
-F, --info-script=NAME, --new-volume-script=NAME
                       run script at end of each tape (implies -M)
-L, --tape-length=NUMBER  change tape after writing NUMBER x 1024 bytes
-M, --multi-volume      create/list/extract multi-volume archive
--rmt-command=COMMAND  use given rmt COMMAND instead of rmt
--rsh-command=COMMAND  use remote COMMAND instead of rsh
--volno-file=FILE      use/update the volume number in FILE
```

Device blocking:

```
-b, --blocking-factor=BLOCKS  BLOCKS x 512 bytes per record
-B, --read-full-records      reblock as we read (for 4.2BSD pipes)
-i, --ignore-zeros          ignore zeroed blocks in archive (means EOF)
--record-size=NUMBER        NUMBER of bytes per record, multiple of 512
```

Archive format selection:

-H, --format=FORMAT create archive of the given format

FORMAT is one of the following:

| | |
|--------|----------------------------------|
| gnu | GNU tar 1.13.x format |
| oldgnu | GNU format as per tar <= 1.12 |
| pax | POSIX 1003.1-2001 (pax) format |
| posix | same as pax |
| ustar | POSIX 1003.1-1988 (ustar) format |
| v7 | old V7 tar format |

--old-archive, --portability

same as --format=v7

--pax-option=keyword[:=value][,keyword[:=value]]...

control pax keywords

--posix

same as --format=posix

-V, --label=TEXT

create archive with volume name TEXT; at
list/extract time, use TEXT as a globbing pattern
for volume name

Compression options:

-a, --auto-compress use archive suffix to determine the compression
program

-I, --use-compress-program=PROG

filter through PROG (must accept -d)

-j, --bzip2

filter the archive through bzip2

-J, --xz

filter the archive through xz

--lzip

filter the archive through lzip

--lzma

filter the archive through lzma

--lzop

--no-auto-compress

do not use archive suffix to determine the
compression program

-z, --gzip, --gunzip, --ungzip filter the archive through gzip

-Z, --compress, --uncompress filter the archive through compress

Local file selection:

--add-file=FILE add given FILE to the archive (useful if its name starts with a dash)

--backup[=CONTROL] backup before removal, choose version CONTROL

-C, --directory=DIR change to directory DIR

--exclude=PATTERN exclude files, given as a PATTERN

--exclude-backups exclude backup and lock files

--exclude-caches exclude contents of directories containing CACHEDIR.TAG, except for the tag file itself

--exclude-caches-all exclude directories containing CACHEDIR.TAG

--exclude-caches-under exclude everything under directories containing CACHEDIR.TAG

--exclude-tag=FILE exclude contents of directories containing FILE, except for FILE itself

--exclude-tag-all=FILE exclude directories containing FILE

--exclude-tag-under=FILE exclude everything under directories containing FILE

--exclude-vcs exclude version control system directories

-h, --dereference follow symlinks; archive and dump the files they point to

--hard-dereference follow hard links; archive and dump the files they refer to

-K, --starting-file=MEMBER-NAME begin at member MEMBER-NAME in the archive

--newer-mtime=DATE compare date and time when data changed only

--no-null disable the effect of the previous --null option

--no-recursion avoid descending automatically in directories

--no-unquote do not unquote filenames read with -T

--null -T reads null-terminated names, disable -C

-N, --newer=DATE-OR-FILE, --after-date=DATE-OR-FILE only store files newer than DATE-OR-FILE

```
--one-file-system    stay in local file system when creating archive
-P, --absolute-names  don't strip leading `/'s from file names
--recursion          recurse into directories (default)
--suffix=STRING      backup before removal, override usual suffix ('~'
                    unless overridden by environment variable
                    SIMPLE_BACKUP_SUFFIX)
-T, --files-from=FILE  get names to extract or create from FILE
--unquote            unquote filenames read with -T (default)
-X, --exclude-from=FILE  exclude patterns listed in FILE
```

File name transformations:

```
--strip-components=NUMBER  strip NUMBER leading components from file
                            names on extraction
--transform=EXPRESSION, --xform=EXPRESSION
                            use sed replace EXPRESSION to transform file
                            names
```

File name matching options (affect both exclude and include patterns):

```
--anchored            patterns match file name start
--ignore-case         ignore case
--no-anchored         patterns match after any `/' (default for
                    exclusion)
--no-ignore-case     case sensitive matching (default)
--no-wildcards        verbatim string matching
--no-wildcards-match-slash  wildcards do not match `/'
--wildcards           use wildcards (default for exclusion)
--wildcards-match-slash  wildcards match `/' (default for exclusion)
```

Informative output:

```
--checkpoint[=NUMBER]  display progress messages every NUMBERth record
                    (default 10)
```

```
--checkpoint-action=ACTION  execute ACTION on each checkpoint
--full-time                  print file time to its full resolution
--index-file=FILE           send verbose output to FILE
-l, --check-links           print a message if not all links are dumped
--no-quote-chars=STRING     disable quoting for characters from STRING
--quote-chars=STRING        additionally quote characters from STRING
--quoting-style=STYLE       set name quoting style; see below for valid STYLE
                             values
-R, --block-number          show block number within archive with each
                             message
--show-defaults             show tar defaults
--show-omitted-dirs         when listing or extracting, list each directory
                             that does not match search criteria
--show-transformed-names, --show-stored-names
                             show file or archive names after transformation
--totals[=SIGNAL]           print total bytes after processing the archive;
                             with an argument - print total bytes when this
                             SIGNAL is delivered; Allowed signals are: SIGHUP,
                             SIGQUIT, SIGINT, SIGUSR1 and SIGUSR2; the names
                             without SIG prefix are also accepted
--utc                       print file modification times in UTC
-v, --verbose               verbosely list files processed
--warning=KEYWORD           warning control
-w, --interactive, --confirmation
                             ask for confirmation for every action
```

Compatibility options:

```
-o                          when creating, same as --old-archive; when
                             extracting, same as --no-same-owner
```

Other options:

```
-, --help                   give this help list
```

```
--restrict      disable use of some potentially harmful options
--usage        give a short usage message
--version      print program version
```

Mandatory or optional arguments to long options are also mandatory or optional for any corresponding short options.

The backup suffix is '~', unless set with --suffix or SIMPLE_BACKUP_SUFFIX.
The version control may be set with --backup or VERSION_CONTROL, values are:

```
none, off      never make backups
t, numbered    make numbered backups
nil, existing  numbered if numbered backups exist, simple otherwise
never, simple  always make simple backups
```

Valid arguments for the --quoting-style option are:

```
literal
shell
shell-always
c
c-maybe
escape
locale
clocale
```

This tar defaults to:

```
--format=gnu -f- -b20 --quoting-style=escape --rmt-command=/usr/lib/rmt
--rsh-command=/usr/bin/rsh
```

Report bugs to <bug-tar@gnu.org>.

Exercices

Vous allez maintenant sauvegarder votre dossier **test** ainsi que son contenu vers un fichier :

```
opensuse:/test/repZ # tar cvf /tmp/test.tar /test
tar: Removing leading `/' from member names
/test/
/test/repY/
/test/repY/Y1
/test/repY/Y3
/test/repY/Y2
/test/repZ/
/test/repZ/Z1
/test/repZ/Z2
```

Pour visualiser la **table of contents** de votre sauvegarde, utilisez la commande suivante :

```
opensuse:/test/repZ # tar tvf /tmp/test.tar
drwxr-xr-x root/root      0 2012-02-01 12:07 test/
drwxr-xr-x root/root      0 2012-02-01 12:08 test/repY/
-rw-r--r-- root/root      0 2012-02-01 12:08 test/repY/Y1
-rw-r--r-- root/root      0 2012-02-01 12:08 test/repY/Y3
-rw-r--r-- root/root      0 2012-02-01 12:08 test/repY/Y2
drwxr-xr-x root/root      0 2012-02-01 12:08 test/repZ/
-rw-r--r-- root/root      0 2012-02-01 12:08 test/repZ/Z1
-rw-r--r-- root/root      0 2012-02-01 12:08 test/repZ/Z2
```

Afin de créer une sauvegarde incrémentale, vous avez besoin de créer un fichier qui servira de référence de date :

```
opensuse:/test/repZ # touch /tmp/dateref
```

Modifiez maintenant deux des fichiers de votre arborescence **test** :

```
opensuse:/test/repZ # echo "openSUSE est super \!" > /test/repY/Y1
opensuse:/test/repZ # echo "openSUSE is wonderful \!" > /test/repZ/Z1
```

Pour procéder à votre sauvegarde incrémentale, vous devez sauvegarder uniquement les fichiers modifiés ou créés depuis la création de votre fichier **/tmp/dateref**.

Saisissez donc la commande suivante :

```
opensuse:/test/repZ # tar -cvf /tmp/incremental.tar -N /tmp/dateref /test
tar: Removing leading `/' from member names
/test/
/test/repY/
/test/repY/Y1
tar: /test/repY/Y3: file is unchanged; not dumped
tar: /test/repY/Y2: file is unchanged; not dumped
/test/repZ/
/test/repZ/Z1
tar: /test/repZ/Z2: file is unchanged; not dumped
```

<note important> Notez l'utilisation de l'option **-N** avec l'argument **/tmp/dateref** qui permet d'identifier les fichiers modifiés ou créés depuis la création de **/tmp/dateref**. </note>

Contrôlez maintenant le contenu de l'archive **/tmp/incremental.tar** :

```
opensuse:/test/repZ # tar tvf /tmp/incremental.tar
drwxr-xr-x root/root      0 2012-02-01 12:07 test/
drwxr-xr-x root/root      0 2012-02-01 12:08 test/repY/
-rw-r--r-- root/root     22 2012-02-01 17:00 test/repY/Y1
drwxr-xr-x root/root      0 2012-02-01 12:08 test/repZ/
-rw-r--r-- root/root     25 2012-02-01 17:00 test/repZ/Z1
```

Supprimez maintenant le contenu du répertoire **test** :

```
opensuse:/test/repZ # rm -rf /test/*
```

<note important> Notez que le système vous permet de supprimer le répertoire **/test/repZ**, or vous vous situez dans ce même répertoire ! </note>

Afin de pouvoir restaurer les fichiers de votre première sauvegarde, placez-vous à la racine de votre système et restaurez le contenu de votre répertoire **test** en saisissant la commande tar suivante :

```
opensuse:/test/repZ # cd /
opensuse:/ # tar xvf /tmp/test.tar
test/
test/repY/
test/repY/Y1
test/repY/Y3
test/repY/Y2
test/repZ/
test/repZ/Z1
test/repZ/Z2
```

Constatez maintenant que l'opération s'est bien déroulée :

```
opensuse:/ # ls -lR /test
/test:
total 8
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repY
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repZ

/test/repY:
total 0
-rw-r--r-- 1 root root 0 Feb  1 12:08 Y1
-rw-r--r-- 1 root root 0 Feb  1 12:08 Y2
-rw-r--r-- 1 root root 0 Feb  1 12:08 Y3

/test/repZ:
total 0
-rw-r--r-- 1 root root 0 Feb  1 12:08 Z1
-rw-r--r-- 1 root root 0 Feb  1 12:08 Z2
```

<note important> Notez qu'à ce stade les fichiers **/test/repY/Y1** et **/test/repZ/Z1** sont vides. </note>

Restaurez maintenant votre archive incrémentale :

```
opensuse:/ # tar xvf /tmp/incremental.tar
test/
test/repY/
test/repY/Y1
test/repZ/
test/repZ/Z1
```

Constatez maintenant que l'opération s'est bien déroulée :

```
opensuse:/ # ls -lR /test
/test:
total 8
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repY
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repZ

/test/repY:
total 4
-rw-r--r-- 1 root root 22 Feb  1 17:00 Y1
-rw-r--r-- 1 root root  0 Feb  1 12:08 Y2
-rw-r--r-- 1 root root  0 Feb  1 12:08 Y3

/test/repZ:
total 4
-rw-r--r-- 1 root root 25 Feb  1 17:00 Z1
-rw-r--r-- 1 root root  0 Feb  1 12:08 Z2
```

<note important> Notez que les fichiers **/test/repY/Y1** et **/test/repZ/Z1** sont maintenant non-vides. </note>

cpio

Présentation

La commande **cpio** (Copy Input To Output). cpio peut gérer les archives au format **tar**. La différence majeure entre tar et cpio est que ce dernier stocke les chemins d'accès aux fichiers sauvegardés en même temps que les fichiers eux-mêmes. Ceci implique que dans le cas où le chemin absolu a été spécifié lors de la sauvegarde, il est impossible de restaurer un fichier à un autre emplacement que son emplacement d'origine.

Vous allez utiliser maintenant le logiciel **cpio** pour effectuer les sauvegardes et restaurations.

Options de la Commande

Les options de la commande **cpio** sont :

```
opensuse:/ # cpio --help
Usage: cpio [OPTION...] [destination-directory]
GNU `cpio' copies files to and from archives

Examples:
# Copy files named in name-list to the archive
cpio -o < name-list [> archive]
# Extract files from the archive
cpio -i [< archive]
# Copy files named in name-list to destination-directory
cpio -p destination-directory < name-list

Main operation mode:
-i, --extract          Extract files from an archive (run in copy-in
                        mode)
-o, --create          Create the archive (run in copy-out mode)
-p, --pass-through    Run in copy-pass mode
```

-t, --list Print a table of contents of the input

Operation modifiers valid in any mode:

 --block-size=BLOCK-SIZE Set the I/O block size to BLOCK-SIZE * 512
 bytes
-B Set the I/O block size to 5120 bytes
-c Use the old portable (ASCII) archive format
-C, --io-size=NUMBER Set the I/O block size to the given NUMBER of
 bytes
 --force-local Archive file is local, even if its name contains
 colons
-f, --nonmatching Only copy files that do not match any of the given
 patterns
-F, --file=[[USER@]HOST:]FILE-NAME
 Use this FILE-NAME instead of standard input or
 output. Optional USER and HOST specify the user
 and host names in case of a remote archive
-H, --format=FORMAT Use given archive FORMAT
-M, --message=STRING Print STRING when the end of a volume of the
 backup media is reached
-n, --numeric-uid-gid In the verbose table of contents listing, show
 numeric UID and GID
 --quiet Do not print the number of blocks copied
 --rsh-command=COMMAND Use remote COMMAND instead of rsh
-v, --verbose Verbosely list the files processed
-V, --dot Print a "." for each file processed
-W, --warning=FLAG Control warning display. Currently FLAG is one of
 'none', 'truncate', 'all'. Multiple options
 accumulate.

Operation modifiers valid only in copy-in mode:

-b, --swap Swap both halfwords of words and bytes of

```
halfwords in the data. Equivalent to -sS
-r, --rename           Interactively rename files
-s, --swap-bytes      Swap the bytes of each halfword in the files
-S, --swap-halfwords  Swap the halfwords of each word (4 bytes) in the
                      files
--to-stdout           Extract files to standard output

-E, --pattern-file=FILE Read additional patterns specifying filenames to
                      extract or list from FILE
--only-verify-crc     When reading a CRC format archive, only verify the
                      CRC's of each file in the archive, don't actually
                      extract the files
```

Operation modifiers valid only in copy-out mode:

```
-A, --append           Append to an existing archive.
-O [[USER@]HOST:]FILE-NAME Archive filename to use instead of standard
                      output. Optional USER and HOST specify the user
                      and host names in case of a remote archive
```

Operation modifiers valid only in copy-pass mode:

```
-l, --link             Link files instead of copying them, when
                      possible
```

Operation modifiers valid in copy-in and copy-out modes:

```
--absolute-filenames  Do not strip file system prefix components from
                      the file names
--no-absolute-filenames Create all files relative to the current
                      directory
```

Operation modifiers valid in copy-out and copy-pass modes:

```
-0, --null          A list of filenames is terminated by a null
                    character instead of a newline
-a, --reset-access-time  Reset the access times of files after reading them
-I [[USER@]HOST:]FILE-NAME Archive filename to use instead of standard input.
                    Optional USER and HOST specify the user and host
                    names in case of a remote archive
-L, --dereference      Dereference symbolic links (copy the files
                    that they point to instead of copying the links).
-R, --owner=[USER][:][GROUP] Set the ownership of all files created to the
                    specified USER and/or GROUP
```

Operation modifiers valid in copy-in and copy-pass modes:

```
-d, --make-directories  Create leading directories where needed
-m, --preserve-modification-time
                    Retain previous file modification times when
                    creating files
--no-preserve-owner     Do not change the ownership of the files
--sparse                Write files with large blocks of zeros as sparse
                    files
-u, --unconditional     Replace all files unconditionally

-?, --help              give this help list
--usage                 give a short usage message
--version                print program version
```

Mandatory or optional arguments to long options are also mandatory or optional for any corresponding short options.

Report bugs to <bug-cpio@gnu.org>.

Exercices

Dans un premier temps, vous devez utiliser la commande **find** pour construire une liste de fichiers à sauvegarder :

```
opensuse:/ # find /test > /tmp/cpio.liste
opensuse:/ # cat /tmp/cpio.liste
/test
/test/repY
/test/repY/Y1
/test/repY/Y3
/test/repY/Y2
/test/repZ
/test/repZ/Z1
/test/repZ/Z2
```

Sauvegardez maintenant les fichiers et répertoires référencés par le fichier **/tmp/cpio.liste** :

```
opensuse:/ # cpio -ov < /tmp/cpio.liste > /tmp/test.cpio
/test
/test/repY
/test/repY/Y1
/test/repY/Y3
/test/repY/Y2
/test/repZ
/test/repZ/Z1
/test/repZ/Z2
1 block
```

Consultez maintenant la **table of contents** de votre sauvegarde :

```
opensuse:/ # cpio -it < /tmp/test.cpio
/test
/test/repY
/test/repY/Y1
/test/repY/Y3
/test/repY/Y2
```

```
/test/repZ
/test/repZ/Z1
/test/repZ/Z2
1 block
```

Supprimez maintenant le répertoire **/test/repY** et son contenu :

```
opensuse:/ # rm -rf /test/repY
```

Contrôlez le bon déroulement de la suppression :

```
opensuse:/ # ls -lR /test
/test:
total 4
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repZ

/test/repZ:
total 4
-rw-r--r-- 1 root root 25 Feb  1 17:00 Z1
-rw-r--r-- 1 root root  0 Feb  1 12:08 Z2
```

Restaurez les fichiers supprimés :

```
opensuse:/ # cpio -ivdum "/test/repY/*" < /tmp/test.cpio
/test/repY/Y1
/test/repY/Y3
/test/repY/Y2
1 block
```

<note important> Notez l'utilisation de la chaîne **"/test/repY/*"** qui permet de rechercher uniquement le répertoire **repY** ainsi que les fichiers **Y1**, **Y2** et **Y3** dans l'archive test.cpio. </note>

Contrôlez le bon déroulement de la restauration :

```
opensuse:/ # ls -lR /test
/test:
total 8
drwx----- 2 root root 4096 Feb  1 17:07 repY
drwxr-xr-x 2 root root 4096 Feb  1 12:08 repZ

/test/repY:
total 4
-rw-r--r-- 1 root root 22 Feb  1 17:00 Y1
-rw-r--r-- 1 root root  0 Feb  1 12:08 Y2
-rw-r--r-- 1 root root  0 Feb  1 12:08 Y3

/test/repZ:
total 4
-rw-r--r-- 1 root root 25 Feb  1 17:00 Z1
-rw-r--r-- 1 root root  0 Feb  1 12:08 Z2
```

dd

Présentation

La commande **dd** n'est pas réellement une commande de sauvegarde.

La commande **dd** copie le fichier passé en entrée dans le fichier de sortie en limitant le nombre d'octets copiés par l'utilisation de deux options :

- **count**
 - le nombre
- **bs**
 - la taille du bloc à copier

Options de la Commande

Les options de la commande **dd** sont :

```
opensuse:/ # dd --help
Usage: dd [OPERAND]...
  or:  dd OPTION
Copy a file, converting and formatting according to the operands.

bs=BYTES      read and write BYTES bytes at a time (also see ibs=,obs=)
cbs=BYTES      convert BYTES bytes at a time
conv=CONVS     convert the file as per the comma separated symbol list
count=BLOCKS  copy only BLOCKS input blocks
ibs=BYTES      read BYTES bytes at a time (default: 512)
if=FILE        read from FILE instead of stdin
iflag=FLAGS    read as per the comma separated symbol list
obs=BYTES      write BYTES bytes at a time (default: 512)
of=FILE        write to FILE instead of stdout
oflag=FLAGS    write as per the comma separated symbol list
seek=BLOCKS    skip BLOCKS obs-sized blocks at start of output
skip=BLOCKS    skip BLOCKS ibs-sized blocks at start of input
status=noxfer  suppress transfer statistics
```

BLOCKS and BYTES may be followed by the following multiplicative suffixes:
c =1, w =2, b =512, kB =1000, K =1024, MB =1000*1000, M =1024*1024, xM =M
GB =1000*1000*1000, G =1024*1024*1024, and so on for T, P, E, Z, Y.

Each CONV symbol may be:

```
ascii    from EBCDIC to ASCII
ebcdic   from ASCII to EBCDIC
ibm      from ASCII to alternate EBCDIC
block    pad newline-terminated records with spaces to cbs-size
```

```
unblock  replace trailing spaces in cbs-size records with newline
lcase    change upper case to lower case
nocreat  do not create the output file
excl     fail if the output file already exists
notrunc  do not truncate the output file
ucase    change lower case to upper case
swab     swap every pair of input bytes
noerror  continue after read errors
sync     pad every input block with NULs to ibs-size; when used
         with block or unblock, pad with spaces rather than NULs
fdatsync physically write output file data before finishing
fsync    likewise, but also write metadata
```

Each FLAG symbol may be:

```
append   append mode (makes sense only for output; conv=notrunc suggested)
direct   use direct I/O for data
directory fail unless a directory
dsync    use synchronized I/O for data
sync     likewise, but also for metadata
fullblock accumulate full blocks of input (iflag only)
nonblock use non-blocking I/O
noatime  do not update access time
noctty   do not assign controlling terminal from file
nofollow do not follow symlinks
```

Sending a USR1 signal to a running `dd' process makes it print I/O statistics to standard error and then resume copying.

```
$ dd if=/dev/zero of=/dev/null& pid=$!
$ kill -USR1 $pid; sleep 1; kill $pid
18335302+0 records in
18335302+0 records out
9387674624 bytes (9.4 GB) copied, 34.6279 seconds, 271 MB/s
```

Options are:

```
--help      display this help and exit
--version   output version information and exit
```

```
Report dd bugs to bug-coreutils@gnu.org
GNU coreutils home page: <http://www.gnu.org/software/coreutils/>
General help using GNU software: <http://www.gnu.org/gethelp/>
Report dd translation bugs to <http://translationproject.org/team/>
For complete documentation, run: info coreutils 'dd invocation'
```

Exercices

Vous allez utiliser maintenant le logiciel **dd** pour effectuer une sauvegarde de votre MBR et de la FAT.

Effectuez une sauvegarde de votre MBR qui se trouve dans les premiers 446 octets de votre disque **/dev/sda** :

```
opensuse:/ # dd if=/dev/sda of=/tmp/mbr.save bs=1 count=446
446+0 records in
446+0 records out
446 bytes (446 B) copied, 0.00283065 s, 158 kB/s
```

Effectuez maintenant une sauvegarde de votre FAT qui se trouve dans les 64 octets après les 446 précédemment sauvegardés :

```
opensuse:/ # dd if=/dev/sda of=/tmp/fat.save bs=1 count=64 skip=446
64+0 records in
64+0 records out
64 bytes (64 B) copied, 0.000208915 s, 306 kB/s
```

<note important> Notez l'utilisation de l'option **skip** qui permet de positionner le début de la sauvegarde au 447^{ième} octet. </note>

dump et restore

Présentation

Les commandes **dump** et **restore** se basent sur le format d'enregistrement des données (ext3). Pour cette raison il n'est pas possible de sauvegarder des répertoires à l'intérieur d'un système de fichiers mais uniquement des systèmes de fichiers complets.

Il est important de noter que le système de fichier ne doit pas être utilisé pendant le processus de dump. Pour cette raison il est normalement conseillé de démonter le système de fichiers.

Il existe 10 niveaux de dump possibles de **0** à **9**. Lors d'un dump le niveau est spécifié. Chaque fois qu'un dump est effectué, cette information est sauvegardée dans le fichier `/etc/dumpdates`.

Par définition un dump de niveau **0** est une sauvegarde complète tandis que le dump de niveau 1 est une sauvegarde incrémentale.

Notez que les fichiers sont sauvegardés avec des nom relatifs. Ceci implique que vous devez vous positionner dans le système de fichiers lors de la restauration avec la commande **restore**.

Compression

gzip

Présentation

La commande **gzip** est un utilitaire de compression sous GNU/Linux. La commande **gunzip** est un utilitaire de décompression sous GNU/Linux.

Options des Commandes

Les options de la commande **gzip** sont :

```
opensuse:/ # gzip --help
Usage: gzip [OPTION]... [FILE]...
Compress or uncompress FILEs (by default, compress FILEs in-place).

Mandatory arguments to long options are mandatory for short options too.

  -c, --stdout      write on standard output, keep original files unchanged
  -d, --decompress  decompress
  -f, --force       force overwrite of output file and compress links
  -h, --help       give this help
  -l, --list        list compressed file contents
  -L, --license     display software license
  -n, --no-name     do not save or restore the original name and time stamp
  -N, --name       save or restore the original name and time stamp
  -q, --quiet       suppress all warnings
  -r, --recursive  operate recursively on directories
  -S, --suffix=SUF use suffix SUF on compressed files
  -t, --test       test compressed file integrity
  -v, --verbose     verbose mode
  -V, --version    display version number
  -1, --fast       compress faster
  -9, --best       compress better
  --rsyncable     Make rsync-friendly archive
```

With no FILE, or when FILE is -, read standard input.

Report bugs to <bug-gzip@gnu.org>.

Les options de la commande **gunzip** sont :

```
opensuse:/ # gunzip --help
Usage: /usr/bin/gunzip [OPTION]... [FILE]...
Uncompress FILEs (by default, in-place).
```

Mandatory arguments to long options are mandatory for short options too.

```
-c, --stdout      write on standard output, keep original files unchanged
-f, --force       force overwrite of output file and compress links
-l, --list        list compressed file contents
-n, --no-name     do not save or restore the original name and time stamp
-N, --name        save or restore the original name and time stamp
-q, --quiet       suppress all warnings
-r, --recursive  operate recursively on directories
-S, --suffix=SUF use suffix SUF on compressed files
-t, --test        test compressed file integrity
-v, --verbose     verbose mode
  --help          display this help and exit
  --version       display version information and exit
```

With no FILE, or when FILE is -, read standard input.

Report bugs to <bug-gzip@gnu.org>.

Exercices

Utilisez **gzip** pour compresser votre fichier tar :

```
opensuse:/ # gzip /tmp/test.tar
```

Constatez la taille du fichier **test.tar.gz** :

```
opensuse:/ # ls -l /tmp/test.tar.gz
-rw-r--r-- 1 root root 221 Feb  1 16:57 /tmp/test.tar.gz
```

<note important> Notez que le fichier compressé a été créé dans le même répertoire que le fichier source et que le fichier source a disparu. </note>

Décompressez le fichier test.tar.gz :

```
opensuse:/ # gunzip /tmp/test.tar.gz
```

bzip2

Présentation

La commande **bzip2** est un utilitaire de compression sous GNU/Linux. La commande **bunzip2** est un utilitaire de décompression sous GNU/Linux.

Options des Commandes

Les options de la commande **bzip2** sont :

```
opensuse:/ # bzip2 --help
bzip2, a block-sorting file compressor.  Version 1.0.6, 6-Sept-2010.
```

```
usage: bzip2 [flags and input files in any order]
```

```
-h --help          print this message
-d --decompress   force decompression
-z --compress     force compression
-k --keep         keep (don't delete) input files
-f --force        overwrite existing output files
-t --test         test compressed file integrity
-c --stdout       output to standard out
-q --quiet        suppress noncritical error messages
-v --verbose      be verbose (a 2nd -v gives more)
-L --license      display software version & license
-V --version      display software version & license
-s --small        use less memory (at most 2500k)
-1 .. -9         set block size to 100k .. 900k
```

```
--fast          alias for -1
--best          alias for -9
```

If invoked as `bzip2', default action is to compress.
as `bunzip2', default action is to decompress.
as `bzcata', default action is to decompress to stdout.

If no file names are given, bzip2 compresses or decompresses
from standard input to standard output. You can combine
short flags, so `-v -4' means the same as -v4 or -4v, &c.

Les options de la commande **bunzip2** sont :

```
opensuse:/ # bunzip2 --help
bzip2, a block-sorting file compressor.  Version 1.0.6, 6-Sept-2010.
```

```
usage: bunzip2 [flags and input files in any order]
```

```
-h --help          print this message
-d --decompress    force decompression
-z --compress      force compression
-k --keep          keep (don't delete) input files
-f --force         overwrite existing output files
-t --test          test compressed file integrity
-c --stdout        output to standard out
-q --quiet         suppress noncritical error messages
-v --verbose       be verbose (a 2nd -v gives more)
-L --license       display software version & license
-V --version       display software version & license
-s --small         use less memory (at most 2500k)
-l .. -9          set block size to 100k .. 900k
--fast            alias for -1
--best            alias for -9
```

```
If invoked as `bzip2', default action is to compress.  
    as `bunzip2', default action is to decompress.  
    as `bzipcat', default action is to decompress to stdout.
```

```
If no file names are given, bzip2 compresses or decompresses  
from standard input to standard output. You can combine  
short flags, so `-v -4' means the same as -v4 or -4v, &c.
```

Exercices

Utilisez **bzip2** pour compresser votre fichier tar :

```
opensuse:/ # bzip2 /tmp/test.tar
```

Constatez la taille du fichier **tar.bz2** :

```
opensuse:/ # ls -l /tmp | grep test.tar.bz2  
-rw-r--r-- 1 root    root    199 Feb  1 16:57 test.tar.bz2
```

<note important> Notez que le fichier compressé a été créé dans le même répertoire que le fichier source et que le fichier source a disparu. </note>

Décompressez le fichier tar.bz2 :

```
opensuse:/ # bunzip2 /tmp/test.tar.bz2
```

<note important> La commande **compress** peut également être utilisée pour compresser un fichier. </note>

~~DISCUSSION:off~~
